

RTA(O)M

Thermal actuator 100 or 125 N

Thermal actuators with position indication for control of valves in heating or cooling systems. The actuator can be used to control radiator circuits, solar heating systems, heating or cooling coils, floor heating, etc.

- ✓ Protection class IP54
- ✓ Stroke 4 or 6.5 mm
- ✓ 100 % protection against leaky valves
- ✓ Noiseless and maintenance-free
- ✓ Available in normally closed (NC) or normally open (NO) models
- ✓ Power consumption 1 or 1.2 W
- ✓ Modern and compact design

Function

The actuator uses a PTC resistor-heated elastic element and a compression spring. When the supply voltage is switched on, the wax element is heated, moving the integrated piston. The force generated by the movement is transferred to the valve stem, opening and closing the valve.

Installation

The actuator connects to the valve using an adapter with a snap-on connection. The actuator can be mounted vertically or horizontally. Upside down mounting is also possible but might reduce the life of the actuator.

Initiation

Normally closed (NC) type actuators are delivered with the actuator fixed in an open position. This means hydraulic circuits can be filled and vented with the actuator mounted. The valve will remain open until the actuator has been activated for more than 6 minutes and the power supply interrupted.

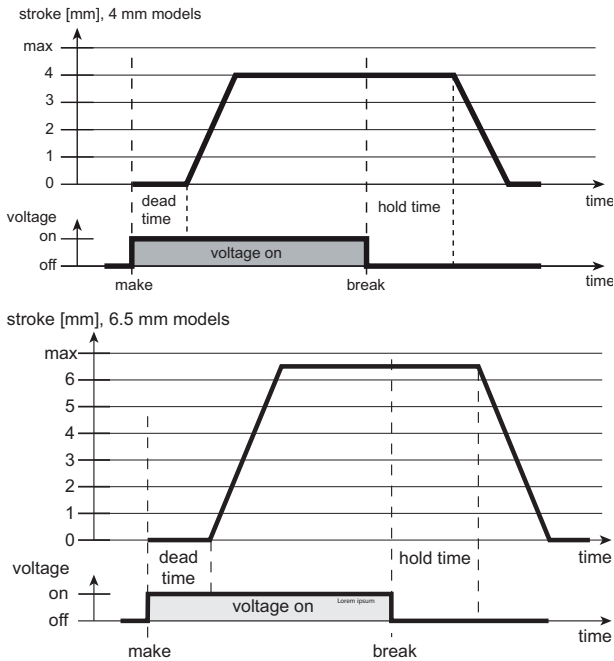

Adjustment to valves of other brands

The actuator can be adjusted to almost any brand of valve by simply connecting the actuator to a snap-on adapter. A model overview is available in the adapter model table on page 3. The actuator uses a patented solution which offers 100 % protection against leaking valves, ensuring a long lifespan.

Normally closed (NC) models

Once the supply voltage is applied and the dead time has expired, the valve will open* as the actuator stem retracts inwards. Once the supply voltage is cut and the hold time has expired, the wax element will cool and the valve will close* through the closing force of the compression spring and actuator stem extending outward. The closing force of the compression spring keeps the valve normally closed.

* This applies to valves that close when the stem is pushed down.

Normally open (NO) models

For normally open actuator models, the actuator will function in the opposite way to normally closed models.
